In physics, motion is the change in position of an object with respect to its surroundings in a given interval of time . Motion is mathematically described in terms of displacement, distance, velocity, acceleration, time, and speed.Motion of a body is observed by attaching a frame of reference to an observer and measuring the change in position of the body relative to that frame.

This procedure, as well the rest of the paper assumes large scale homogeneity and isotropy. Even if there are small (perturbative) deviations from homogeneity, these can be absorbed in an effective density  $\rho$ . Further these do not affect the dark energy ...
